~~FIG. 4~~ FIG. 5 illustrates the separate operation of the form generation module 222 of the printing device 102 and the form generation module 422 of the local computing device 110. The operation of these modules 222 and 422 is discussed together in reference to FIG. 5 because they operate in similar manner to achieve the same result. As indicated in block 500, the form generation module 222, 422 first awaits reading of a data card. This reading can occur, for example, in response to a user or other person inserting a data card 112 into the card reader 208 associated with the printing device 102 associated with the card reader 408 of the local computing device 110 as the case may be. Once the reading of a data card is detected, as indicated in block 502, the form generation module 222, 422 receives location information relevant to user information, as indicated in block 504, that will be used to, at least partially, complete one or more forms to be printed by the printing device 102. This location information can comprise an address, such as a universal resource locator (URL), that identifies where the information is stored on the network 108 so that the printing device 102 or local computing device 110 can retrieve the information.
